

Collaboration and Co-Ordination in Area-Based Initiatives

TABLE 1
Collaborative Structures

Coordination	This represents a common practice of groups, organizations and individuals where information is exchanged and people assist one another to make their own work more efficient. Often this involves arranging schedules and meetings to avoid overlaps in effort. This model involves minimal amounts of involvement by participants, with efficiency being key. It could however become the catalyst for a more developed relationship.
Cooperation/ Partnership	In this model, often associated with management literature, agreement is sought on goals or endeavours. These require a greater commitment than coordination, with an end product often an outcome of the working arrangement. Participants often come together to share resources, space, time and ideas. Confidence and trust in working together are developed over time but do not require deep commitment, intensity of communication, or depth of co-planning by participants. There is an underlying philosophy of teamwork, cooperation and networking, with some sense of interdependence. However cooperation does not necessarily imply shared power or an equitable division of authority.
Integration	This model of collaboration is the most involved and intense. Participants are involved in shared thinking, shared planning and shared creation. Collaborators share responsibility, and conceptualisation is a joint initiative. Partners work closely together and develop a synergy that allows them create together. The distinguishing characteristic of this model is that partners expand their individual potential and create jointly what would be beyond their capacity individually.
